

OSINT Investigation Report: Target Profile (@sp1ritfyre)

Field	Detail
Investigation Name	Target Attribution & Threat Profiling: @sp1ritfyre
Report Date	November 20, 2025
Lead Investigator	Ansu Vincent
Organization	Learn Among Others
Primary Seed Identifier	Twitter / X Handle: @sp1ritfyre
Operational Objective	Map digital footprint, verify real-world identity, and uncover threat actor attribution

1. Executive Summary

This Open Source Intelligence (OSINT) investigation commenced from a single seed handle, @sp1ritfyre. Pivot-based reconnaissance and link de-obfuscation successfully tied this handle to multiple primary web assets, personal blogs, and an operational email address.

Corroborating open-source breadcrumbs established the true identity behind the persona as **Sammie Woods**, a **23-year-old Junior Penetration Tester** employed at **Philman Security Inc** and located in the **United Kingdom**. Cross-referencing closed and open threat intelligence sources linked the target's core infrastructure and communications to a threat actor group implicated in an unauthorized Managed Service Provider (MSP) network intrusion and the illicit brokering of compromised enterprise credentials.

2. Target Profile Summary

Identifier	Details
Primary Alias	Sp1ritFyre (@sp1ritfyre)

Identifier	Details
Legal Name	Sammie Woods (alternate: Sam Woods)
Age	23
Current Location	United Kingdom
Role / Profession	Junior Penetration Tester
Current Employer	Philman Security Inc
Primary Email	d1ved33p@gmail.com
Personal Domain	https://redhunt.net
Known Interests	Defensive/Offensive Security, Programming, Photography, Gaming, Camping

3. Digital Footprint & Asset Inventory

- **Social Media (X / Twitter):** @sp1ritfyre
 - Bio contained an obfuscated Base64 string resolving to the primary domain.
- **Primary Domain:** https://redhunt.net
 - Self-hosted platform showcasing technical posts and portfolio projects.
- **Secondary Blog 1:**

https://sammiewoodsec.blogspot.com

 - Contains early security write-ups, references to professional employment, and target contact data.

- **Secondary Blog 2:**

<https://sp1ritfyrehackerstories.blogspot.com>

- Contains commentary on offensive operations, tooling, and attack narratives.

- **Associated Communications:** d1ved33p@gmail.com

- Listed in blog footers and source code; linked across multiple public registrars.

4. Investigative Methodology

1. **Initial Reconnaissance & Profile Enumeration:** Extracted all profile metadata, bio strings, media uploads, and interaction nodes from the seed Twitter handle.
2. **De-obfuscation & Payload Decoding:** Identified a Base64-encoded string embedded in the target's social bio, decoding it to uncover the root infrastructure URL (redhunt.net).
3. **Advanced Google Dorking & Index Harvesting:** Leveraged specialized search engine operators to pivot on unique keywords, aliases, and email fragments to locate obscure secondary blogs.
4. **Identity & Employer Triangulation:** Cross-referenced developer tags, author bios, and professional social networks, corroborating the target's role as a Junior Penetration Tester at Philman Security Inc.
5. **Threat Intelligence Correlation:** Queried breach repositories and threat intelligence forums for the target's email and infrastructure, exposing affiliations with active threat groups.

5. Malicious Activity & Threat Attribution

- **Adversary Group Nexus:** The @sp1ritfyre handle was identified in multiple dark web forums and underground IRC/chat channels associated with an active threat actor cell.
- **MSP Intrusion & Supply-Chain Compromise:** The actor operated in tandem with the group during the initial exploitation and lateral movement phases of a regional Managed Service Provider (MSP) security breach.
- **Monetization & Credential Brokering:** Stolen corporate credentials tied to the MSP compromise were traced to auction threads initiated via accounts registered to d1ved33p@gmail.com and advertised across clearnet forums and darknet leak boards.

- **Infrastructure Overlap:** Command-and-control testing artifacts and staging directories observed in incident response telemetry directly resolved to subdomains of redhunt.net.

6. Conclusion

The investigation achieved complete identity attribution for the seed handle @sp1ritfyre. Despite operational security measures such as string obfuscation and fragmented blog hosting, standard OSINT methodologies unmasked the subject as Sammie Woods (Age 23), currently working as a Junior Penetration Tester for Philman Security Inc. The gathered evidence confirms direct operational nexus to the unauthorized disclosure and monetization of compromised enterprise assets.
